PROJECT ABSTRACT SUBMISSION

COURSE TITLE & CODE : DATA SCIENCE (24AD3107) A.Y. 2026 - 2027

Title of the project	Sales and Demand Forecasting System	
S. No.	**University ID**	**Name**
1	2420030427	Y. Nimisha
2	2420030498	K. Sanuhya
3	2420030516	R. Sarvajith Varma
Name of the Guide		Dr. N. SUNANDA

Abstract

Sales Pulse is a data science-based Sales and Demand Forecasting System designed to analyze historical sales data and predict future sales or demand. The system applies data preprocessing techniques to handle missing, inconsistent, and incorrect records, followed by exploratory data analysis to identify sales trends, seasonal patterns, and demand variations. Time-series forecasting models such as ARIMA or Prophet are used to generate future sales predictions. The forecast results are evaluated using suitable performance metrics to assess model accuracy. A user-friendly dashboard presents historical sales trends, forecasted values, and important insights in an easy-to-understand manner. The system can help businesses identify high- and low-demand periods, understand sales patterns, and support better inventory and sales planning.

Unlike conventional sales management and reporting software that primarily focuses on recording transactions and presenting historical sales information, SalesPulse integrates historical analysis with predictive forecasting in a single data science application. It not only shows what has happened in the past but also estimates future demand based on identified trends and seasonal patterns. The system also combines preprocessing, visualization, forecasting, model evaluation, and business-oriented insights, providing a more comprehensive approach to sales and demand analysis. The project therefore demonstrates how data science and time-series forecasting can be applied to support informed and proactive business decision-making.
